FOR REFERENCE PURPOSES ONLY-CHECK VEHICLE APPLICATION LISTING FOR CORRECT WIX FILTER

Hsg(Housing) . . . WIX NUMBER is Replacement Element to be used in filter housing assembly.

Italicized Part Numbers May Not Be Available At Time Of Publication.

⁸² ¹⁵⁵ Standard version ¹⁸⁴ Has lid attached ²¹⁷ Truck or Bus applications with oil filter housing that has a spring-loaded long post - has lid attached to filter ²¹⁸ Van applications with housing that has spring-loaded long post - has lid attached to filter ²¹⁹ Only to be used on applications that have a short post without spring in the oil filter housing - no lid attached ²⁴³ Requires reusable plastic bowl ²⁴⁴ Complete spin-on with drain (no plastic bowl required)²⁷⁰ Complete spin-on with drain & sensor port (no plastic bowl required) ⁴¹⁹ With self-venting drain ⁴²⁰ With standard drain ⁴⁷⁹ NanoPro Version ⁵⁰⁵ American version

WS10055		Ten test strips to detect hydro-carbons - instructions on bag - test strips will detect the presence of hydro-carbons like oil, gasoline, diesel, kerosene etc. - The Hydrocarbon Detection Strips* can quickly and accurately determine the presence of hydrocarbons in water. When the Hydrocarbon Detection Strip is introduced into a potential hydrocarbon situation, the light blue strip will turn a darker blue if hydrocarbons are present. The color intensity and size of the darker blue areas are indicators of the quantity of hydrocarbons contained in the sample. If the sample contains no hydrocarbons, the strip will not moisten or discolor.

WS10133		Air Filter Service Gauge for gasoline engines (Remote Mount) Contains gauge, ten feet of hose, 1/8 inch NPT brass fitting and installation instructions	GAUGE							
WS10135		Light Duty Grommet Mounted Air Filter Monitor Kit (Includes Grommet and Instruction Card) - has 10" pressure restriction	GAUGE							
WS10137		Ingersoll-Rand, Doosan Compressors, Generators (filter for compressor oil)	SHYD	5.21	3.683	27X2 MM	Attached	2.729	2.415	.220
WS10138		Racor In-line Fuel Filter for diesel engines rated up to 140 HP - has 2 loose quick connect fittings and reusable plastic bracket - 2 micron (after installing this part, use the fuel element only # WS10139 - bracket is reusable)	F	7.8	6.14					
WS10139		Racor In-line Fuel Filter for diesel engines rated up to 140 HP - 2 micron - this is the element only (if bracket and fittings required, use # WS10138)	F	7.8	6.14					
WS10140		Racor In-line Fuel Filter for diesel engines rated up to 140 HP - has 2 loose quick connect fittings and reusable plastic bracket - 10 micron (after installing this part, the fuel element only is # WS10141 - bracket is reusable)	F	7.8	6.14					
WS10141		Racor In-line Fuel Filter for diesel engines rated up to 140 HP - 10 micron (this is the element only - if you need the bracket & fuel fittings, use # WS10140)	F	7.8	6.14

Air Filter Wraps

Get Heavy Duty Protection For Light Duty Vehicles

Most pickup trucks and utility vehicles are no strangers to heavy-duty dirt. If you drive off-road or on gravel roads, you need more protection than you get with a standard filter.

WIX Filters Two-Stage Air Filter Gives You Heavy Duty Protection

WIX Filters recognizes that all driving environments are not created equal and that some vehicles need more filtering capacity. To meet that need, we designed a foam rubber wrap that slips easily over your WIX air filter to provide extra dirt-holding capacity.

- **Traps particles without restricting air flow.** The foam rubber wrap is specially designed for efficient air flow.
- **Increases up to 100% of the dirt holding capacity of your filter.** That saves you money by extending the life of your filter and giving your engine greater protection.
- **Slips on easily.** To install your WIX filter wrap, simply slip it over your WIX air filter. We have a size for most light truck applications. See the chart below for the filters that utilize the new filter wraps.

WIX HDA-100
Senzit Monitoring Device

Replacing analog air filter service indicators, Senzit from WIX Filters gives you access to the condition of your air filter anytime, anywhere via your smartphone. Just plug the rugged sensor into the air handler service port and download the Senzit app. In return, you'll receive accurate data that will help you protect and maintain your equipment, saving you time and money.

Senzit has been designed for heavy-duty applications and works with any air filter brand. It's the latest in filtration technology.

PRODUCT NEWS BULLETIN

PreCleaners

WIX Pre-Cleaners extend the life of your primary filter by capturing and removing both moisture and large solid contaminants. The inlet fins of the Pre-Cleaner force incoming air into a spinning cyclonic motion. This increased air velocity forces heavier than air contaminants in an outward direction where they are expelled from the Pre-Cleaner through a vented opening. The purged air is then forced on to the primary air filter.

The robust, non-corroding design of WIX Pre-Cleaners make them tolerant to all weather conditions and suitable for use on both on-road and off-road applications.

FEATURES:

- Durable rust resistant design
- Maintenance free
- Easy installation
- Self emptying
- No power required
- WIX is 99% efficient @ 20 Micron or larger
- Operating air flow ranges 90-1,500 CFM

BENEFITS:

- Aids in the removal of moisture and solid contaminants
- Extends the life of primary filter
- Improves system efficiency
- Reduces overall operational cost
- Separates up to 85% of incoming contaminants

Multiple Usage In-Line Fuel Filters

33500 – has adjustable cradles on both ends

These cover a wide range of usage on many Japanese based vehicles. The ability to simply rotate the filters to provide the correct cradle angle and position provides immediate coverage for many new models without having to wait for new product introductions.

Along with greatly reducing inventory levels, these filters offer the advantages of coated steel construction, new copper washers for leak-free fittings and easy installation.

The installation procedure for this filter is as simple as depressurizing the system, carefully removing the old filter, selecting the correct position for the new filter and properly installing it.

33502 – has adjustable cradle on one end only

Fuel Filters - Special Applications Dispensing Equipment

Fuel Pump Filters

A spin-on filter designed for either gasoline or diesel fuel (part no. 24006) was developed for use on dispensing pumps between the pump and the meter. It guarantees the delivery of clean fuel to the vehicle while also protecting the pump meter. The filter can easily be installed, inside or outside the pump. For applications involving a severe dirt situation, the longer 24347 filter can be used. Part number 24348 can be used for dirt and water removal.

If the pump does not come equipped with a filter (and most pumps don't), two filter mounting bases are available. The bases are identical except for the inlet and outlet thread sizes and either base will accept the filters listed below.

In-Hose Fuel Filters

For complete final protection against contaminant entry in the vehicle fuel system, we recommend this in-hose filter that can be easily installed just ahead of the pump nozzle. Equally effective for both diesel and gasoline fuel, the filter features a protective vinyl coating and is approved by Underwriters Laboratories, Inc.

Water Trap Fuel Filter

A must for contractors, farmers, oil exploration crews and others whose gasoline or fuel oil is dispensed from pumps, skid tanks or mobile service facilities. The 24389 filter effectively removes dust, grit, dirt and other airborne contaminants while its water-removing capacity eliminates the hazard and expense of fuel-line freeze-ups in cold climates. The filter consists of a rustproof aluminum body with a removable, transparent bowl which is unaffected by either gasoline or fuel oil. All filters are pressure tested to 100 psi.

The low-cost, easy-to-change replacement filter element for the water trap fuel filter is part no. 24390. The pleated paper element provides 354 sq. inches of filtering surface and is specially treated to remove water from gasoline or diesel fuel.

NOTE: DO NOT use on pressure type dispensing pumps.

Fuel Filters Special Applications Dispensing Equipment

24027 Water Sensor Fuel Pump Filter For Gasoline, Diesel Fuel, Gasoline Blends* and Oxygenated Fuels (MTBE)*

The problem of contamination bulk fuel storage has changed considerably especially with the introduction of alcohol blended or oxygenated fuel. The solid contaminant problem can be greatly increased during changeover period due to the scouring action of the blends on existing corrosion in the storage facilities and delivery lines. The potential water problem has drastically changed. When enough water is introduced into the blends to lower concentration, the alcohol becomes incapable of staying in solution and separates from the fuel. This condition is termed "phased separation". Introduction of fuel in this condition into a vehicle's fuel system will result in erratic engine operation.

Product Features

The WIX 24027 Fuel Dispensing Pump Filter, which can be used with gasoline, diesel fuel, gasoline blends and oxygenated fuels (MTBE), provides numerous features and advantages.

1. Primary filter media of pleated cellulose and chemically enhanced filter media remove solid contaminants and water from the fuel.
2. Secondary filter media – a second layer of chemically enhanced filter media for greater water absorption capacity.
3. Synthetic wrap prevents media migration and acts as final dirt barrier.
4. Woven fiberglass screen supports media migration barrier.
5. Spiral, perforated metal center tube supports filter media and provides for an optimum flow rate.
6. Plated steel end caps prevents leaks from pressure, cracking and corrosion.
7. Plastisol adhesive provides a leak proof seal between the filter media and the end caps.
8. Coiled steel tension spring holds the filter element firmly in place to prevent internal bypass.
9. Specially formulated gasket for leak proof seal.
10. Environmentally friendly filter shell. Differentially coated tinplate can be recycled. Does not contain any hazardous materials.

Installation/Activation

The WIX 24027 Fuel Dispensing Pump Filter is installed on a conventional spin-on filter base between the fuel dispensing tank and the dispensing nozzle. In this position, all fuel must pass through the filter and is cleaned of solid contaminants.

When water is introduced and phase separation occurs, the special sensing layer will selectively absorb the water from the fuel causing it to swell. This will result in an increase in differential pressure and a drop in flow rate from approximately 12 GPM to less than 1 GPM in about 60 seconds. When the special sensing layer is activated and the fuel flow is drastically reduced, this signals the operator that water is present. If a new filter is installed without eliminating the water contamination, the filter will again reduce the rate of fuel flow as it absorbs water.

Fully Tested

Laboratory and field tests have shown our chemically enhanced filter media readily absorbs approximately 8 oz. of water in fuel. When water is introduced and phase separation occurs the pressure drop begins to increase and the flow decreases from approximately 12 GPM to less than 1 GPM in about 60 seconds.

* Maximum 15% Alcohol (Methanol or Ethanol)

Fuel Filters for Special Applications Dispensing Equipment

When the job calls for high speed fuel dispensing, WIX Filters has what it takes. Our high capacity filters are available in 30 GPM and 60 GPM models, which are ideal for truck stops and other commercial high speed fuel dispensing applications.

Additionally, two types of filters are available – solid contaminant removal and solid contaminant removal plus water absorption. Both are offered in 10 and 30 micron ratings.

Replacement elements are available with Water Sensor media to prevent the dispensing of water into vehicle fuel tanks. In fact, the filter automatically shuts off the flow of fuel after approx. 12 ounces of fuel has been removed by the special media.

WIX 33677 Fuel Filter

For most applications, the 10 micron elements are recommended, and especially for high hydrocarbons such as gasoline. For heavier distillates, such as No. 2 fuel oil or diesel, the 30 micron element provides less filtration but offers longer filtration life.

Product Features

Special Water Sensor media prevents passage of water through the filter and shuts off flow when necessary, preventing contaminated fuel from being dispensed.

Water Sensor element contains 700 square inches of filter media; non-water sensor element contains 1700 square inches of filter media.

Fuel Dispensing Filters and Bases

Today's modern engines are more refined and complex than ever and the fuel that they consume has in many cases changed to meet stricter environmental standards. For these reasons and others, it is more important than ever to deliver fuel that is free of contaminants and impurities. Whether you are using traditional or alternative fuels we have the product to meet your needs.

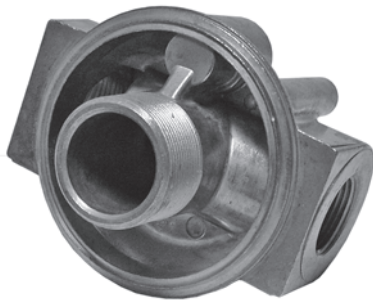

Our dispensing filters:

- Provide high-efficiency particulate filtration.
- Are compatible with Gasoline, Petroleum Diesel, Ethanol blends and Bio-Diesel blends. (See chart for details.)
- Are constructed with epoxy coated shells for corrosion protection.
- Have been extensively tested to meet exacting performance standards.
- Are available for alcohol or alcohol-free fuel.
- Provide enhanced protection from phase separation in alcohol blended fuels. (See chart for details.)

Key-Way Filter Accessories

***Hand Primer - # 24921:**

An optional Hand Primer quickly purges air from the fuel system after an element change, maintaining flow integrity on vacuum-side filter applications.

***150W Heater Kit - # 24922:**

A 12V reliable sensor reacts to the fuel temperature, when needed, activates a high-efficiency heating element. Fuel flows the length of the heater for rapid and uniform warming. Melting wax crystals back into suspension just prior to entering the filter's media, which helps avoid filter plugging.

***12V Water Sensor Kit - # 24923:**

This optional electronic module signals that water has accumulated in the filter and must be drained. Ideal for applications where a see-thru bowl cannot easily be seen (this part # going obsolete – available until inventory depleted).

***See-Thru Plastic Bowl - # 24924:**

A see-thru plastic bowl is a popular option module, allowing immediate and easy visual inspection of water and residue levels. This bowl can be used with all non-marine FM1, FM10 and FM100 Series Fuel Managers that have drains. DO NOT USE ON MARINE APPLICATIONS.

Fuel/Water Separator Filter Installation Kit

24309 Adapter Base

The WIX fuel filter/water separator filter removes harmful solid contaminants and water from fuel on diesel and gasoline engines. Water can be drained through the convenient petcock on the bottom of the filter.

This kit may be used to convert cartridge type filters to convenience of spin-on or can be added as a supplemental filter for increased dirt removal capacity and water removal.

The kit is suitable for use on any size diesel or gasoline engine up to 400 H.P. Ideal for passenger cars and small trucks where original filter is too small or does not remove water.

REPLACEMENT ELEMENTS FOR RVFS SERIES VESSELS

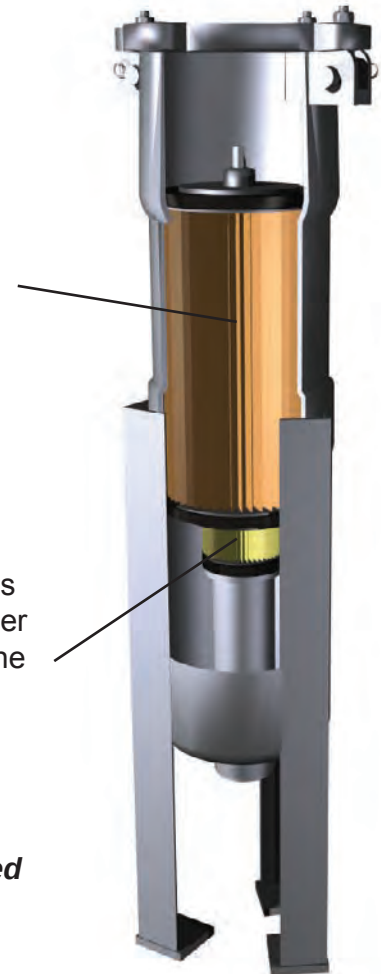

WIX Filters now offers replacement elements for the RVFS Series filter vessels. The RVFS is used primarily to remove emulsified and free water as well as solid contamination from diesel fuel, fuel oils, and other hydrocarbon streams. When using the system for this purpose, two filter elements are required.

Fuel passes through a coalescing filter which provides primary solid particulate filtering and the removal of free water contamination.

The clean fuel then passes through a second fuel/water separating filter to aid in the removal of any remaining emulsified water content.

Note:
Both Filters Are Required

Together these filters provide an effective filtering solution for fuel dispensing, fuel transfer, and large engine applications.

WIX Standard Service Interval (S.S.I.) Coolant Products

How To Use WIX S.S.I. Coolant Products With Supplemental Coolant Additives (S.C.A.s)

Initial Installation

For best product and system performance, the following procedures are required:

1. Start with a clean cooling system. If your system is dirty, completely drain the entire system and chemically clean it with a heavy duty cooling system cleaner. After the system has been cleaned, thoroughly flush the entire system with clean water to insure all the chemical cleaner is removed.
2. Refill your cooling system with the following: 40% to 60% low silicate glycol based antifreeze and clean, soft water. The antifreeze can be either ethylene or propylene glycol type. Engine manufacturers recommend using 50% antifreeze and 50% suitable water.

Clean soft water is defined as clear water containing no more than the following:

Chloride – 40 parts per million or less
Sulfates – 100 parts per million or less
Hardness – 170 parts per million or less (Calcium/Magnesium)

The preferred water for use in cooling systems is deionized, distilled or demineralized. However, if you are using tap water and are unsure of its suitability for use in your cooling system, consult your water supplier for the values of these contaminants or have it evaluated by our coolant analysis laboratory.

3. Refer to the initial service and maintenance chart. Find your cooling system's TOTAL CAPACITY in the left hand column. Then to the right, under column labeled initial installation, find the correct WIX S.S.I. coolant product for your system. Install the correct filter and if necessary, the correct amount of WixCool™. Your cooling system is now ready for use. (Maintenance charts are also included with each filter).

S.S.I. Maintenance Procedures

1. Find your cooling system's TOTAL CAPACITY under the maintenance section of the chart. Then to the right of the capacity, select the correct maintenance filter or filter and WixCool™ liquid combination for the maintenance interval desired. Properly install the selected products in your cooling system.
2. Use a WIX Cooling System Test Kit. To insure that the antifreeze concentration, the coolant's pH level and the WIX coolant conditioner additives are at the proper level, check the cooling system condition every 250 hours or 15,000 miles with a WIX test kit. If testing indicates some maintenance is necessary, please follow maintenance instructions on the text kit instruction card. If your maintenance schedule calls for exceeding 250 hours or 15,000 miles for cooling system maintenance, our Extended Service Interval (E.S.I.) products should be used.

WIX Standard Service Interval (S.S.I.) Coolant Products

Supplemental Coolant Additive (SCA) DCA IV Corrosion Inhibitor

The cooling system must receive complete and proper maintenance to ensure efficient engine operation. Our SCA DCA IV Corrosion Inhibitor is formulated to provide maximum protection for engine cooling systems while providing for Standard Service Interval capabilities.

This inhibitor package is completely compatible with all glycol based coolants (both normal and extended service formulas) concentrated or pre-mixed. It is **NOT** for use in systems using only water. All in-field test kits, regardless of the supplier, are compatible with this new inhibitor formulation.

Our low solids technology approach to this supplemental coolant additive (SCA) virtually eliminates the possibility of gelation problems in properly mixed systems. The presence of greatly reduced total dissolved solids (T.D.S.) in the cooling system results in better heat transferability of the coolant, reduced water pump leakage, a much lower potential for pitting corrosion in metal components, the virtual elimination of cavitation erosion in sleeve assemblies and the potential for extended total system drain and flush intervals.

Solid contamination in the cooling system (dirt, rust, etc.) is eliminated with the use of our coolant filters as they contain a special filter media in addition to the SCA inhibitor. All of our coolant filter cans are epoxy coated to give extra protection from corrosion induced failures.

To insure proper coolant conditioner concentration, use a WIX test kit at intervals of 250 hours or 15,000 miles. When using the test kit, follow maintenance practices outlined in the test kit instruction card. Depletion rates of the WIX Supplement Coolant Additive (SCA) may vary according to engine condition, cooling system condition, engine type or operating condition.

Coolant Test Kits

Cooling systems that have been treated with Dry Chemical Additives (DCA) type Supplemental Coolant Additives (SCA) may be checked with these kits. These kits are not suitable for use with extended service, long life or fully formulated anti-freezes, chemistries or antifreeze colors other than traditional green.

These kits determine the Dry Chemical Additive, Dry Chemical Additive IV and liquid WIXCool™ SCA concentrations. They determine if the SCA concentration level is acceptable, or if the SCA concentration is high or low and, if so, to what degree.

levels of this additive in the coolant. In addition to testing Nitrite levels, our 3-Way test strips also measure the coolant pH and freeze point.

To maintain proper system balance and to ensure accurate SCA test results, the antifreeze concentration must be between 40-60%. We recommend a refractometer (24584 or 24585) be used to accurately determine antifreeze concentration.

Simple, easy to follow, instructions are included with each test kit. The best time to use a test kit is every 250 hours or every 15,000 miles of operation.

Use WIX's refractometer 24584 (Fahrenheit) or 24585 (Celsius) to determine Antifreeze concentration in three easy steps.

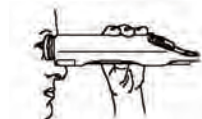

1. Take sample

2. Place a few drops of sample on the measuring prism and close the cover.

3. Hold up to a light and read the scale.

WIX Standard Service Interval (S.S.I.) Liquid Inhibitors

For years, maintenance personnel and supervisors have realized that over half of all premature catastrophic engine failures are directly related to the cooling system. Cooling system problems are usually the result of improper cooling system maintenance techniques and/or simple confusion as to how to use all the cooling system products available today. WIX Filters put an end to all this with a logical solution: WIXCool™ and a 50,000 mile, additive free mechanical filter.

WIXCool™ Liquid Cooling System Treatment

WIXCool™ is a complete one step, low solids liquid cooling system treatment. WIXCool™ is available in 16oz. bottles (part number 24056), ½ gallon containers (part number 24058), 5 gallon containers (part number 24057), and 55 gallon drums (part number 24055). Pour the correct amount based on the **Total Capacity** of the cooling system, directly into the radiator or coolant recovery container. It's just that simple and easy to use. WIXCool™ is a balanced, low solids, film forming inhibitor system specifically designed to protect the metal components of the cooling system while maintaining a favorable alkaline balance. It chemically ties up the hardness in the cooling system fluids to prevent the build-up of rust or scale.

You Have All These Benefits With WIXCool™

- Protects all metals in the cooling system from corrosive attack.
- Keeps engine coolant passages free from heat absorbing sludge and mineral scale build-up, which dramatically reduces the engine's heat transfer capacity.
- Completely compatible with all glycol based antifreezes, both normal service and extended service formulas, concentrated or pre-mixed. It is **NOT** for use in systems using only water.
- Low solids formulation virtually eliminates gelation problems in properly mixed systems.
- Lower total dissolved solids results in reduced water pump leakage, better coolant heat transferability, a lower potential for pitting corrosion and the potential for extended total system drain and flush intervals.
- Provides cavitation erosion protection.
- Has no harmful affect on hoses or other non-metallic parts in cooling system.
- Extends equipment life, reduces down time and maintenance costs.

How To Use WIXCool™

I. Before Treatment

Drain and thoroughly flush the cooling system to remove dirt deposits, oil, rust particles and other additives that require the use of neutralizers (especially in low flow or single pass style cooling systems).

II. Install Additive Free Cooling System Filter

The use of an additive free filter, while not technically required on a system utilizing the liquid WIXCool™ inhibitor, is an excellent way to remove solid contamination in the cooling system and insure long, trouble free cooling system service.

**Dispose Of All Used Cooling System Products in Accordance With
All Applicable Laws and Regulations.**

III. Initial WIXCool™ Treatment

The cooling system must **PRE-CHARGED** with WIXCool™ to provide the proper, initial strength of inhibitors. Add WIXCool™ directly to the cooling system as indicated on the chart below. The system should already contain a mixture of 50% suitable water and 50% glycol based antifreeze. The system's antifreeze concentration should not be lower than 40% or higher than 60%.

Application Chart for **PRE-CHARGING** the Cooling System

The WIX Additive Free Mechanical Coolant Filter

Even if we didn't manufacture filters, we would recommend the use of a mechanical filter for the cooling system. Core sand is always a possibility in an engine. Scale build-up prior to the use of WIXCool™ can break loose causing system problems.

While WIXCool™ will keep your cooling system clean, it won't clean it all by itself! That's why we recommend our low cost, additive free mechanical filter (part number 24070) as part of every cooling system. Part number 24069 can be used where space limitations may be a concern. Additive free type filters are to be used either in systems where our liquid WIXCool™ SCA is being used or where antifreeze, either new or recycled with SCAs already in it, is being used. The additive free filters are NOT to be used in systems using just water or just water and antifreeze.

Frequently Asked Questions About WIXCool™

Is WIXCool™ recommended by major engine companies?

SCA type coolant conditioners (WIXCool™) are recommended by virtually all engine and equipment manufacturers.

Will WIXCool™ separate in my cooling system?

No. WIXCool™ forms a true solution in cooling systems and will not separate.

Can it be used in gasoline engines, including cars?

Yes. You will have the same benefits in gasoline powered units as you do in diesels.

Should I use a filter with soluble oil?

A filter is not absolutely necessary. However, if you start with a clean system, keep it that way with an additive free filter.

Is it compatible with soluble oil?

No. We suggest you remove soluble oil because the ethylene glycol in antifreeze can react with soluble oil to form "green slime". The use of soluble oil and stopleak is not recommended by engine manufacturers. They are not compatible with other additives.

Why use WIXCool™ in addition to antifreeze?

Two reasons: (1) Antifreeze will not prevent scale deposits and (2) the corrosion inhibitors in antifreeze deplete with use.

How does WIXCool™ stop cavitation?

Three ways : (1) By forming a physical barrier (a chemical film), (2) by preventing corrosion of the metal surface, thus strengthening its resistance to cavitation and (3) by reducing foaming which means less air entrapment – a major cause of cavitation.

Must I clean before using?

Yes. However, if your unit is already clean, you may add WIXCool™ directly to it.

How can I remove core sand without a filter?

You can't ! Filters are a must.

Is it compatible with antifreeze?

WIXCool™ is compatible with most glycol-based antifreezes. Consult with WIX Filter Technical Service Department on use with Dowtherm 209 and extended life antifreeze.

What affect does WIXCool™ have on lube oils?

No effect. If coolant gets in lube oil, a sludge will form due to the presence of water and/or antifreeze. WIXCool™ will neither worsen nor prevent the sludge.

Does WIXCool™ attack seals and hoses?

No. It is compatible with all seals and hoses.

Can I overtreat? Can I undertreat?

Yes to both. Follow dosage and change intervals recommended in charts and instruction sheets.

How does it keep my engine running cool and clean?

By preventing scale and corrosion, it provides a clean cooling system, which allows the maximum, original design heat transfer.

How does WIXCool™ stop corrosion?

WIXCool™ contains a balanced film-forming inhibitor system and protects all metals in the cooling system against corrosion while maintaining a beneficial alkaline (pH) environment.

How does it stop scale deposits?

By chemically tying up the hardness in the water to prevent the formation of a hard adherent deposit.

Why is preventing scale deposits important?

Scale retards heat transfer. Because of its insulating properties, only 1/16 of an inch of mineral scale may cause a 40% drop in heat transfer. This can result in over heating causing cracked heads and warped or cracked blocks.

How often is the filter to be changed?

At the time you first add WIXCool™, install a WIX Cooling System Additive Free Filter. Change the filter at 20,000 miles. Install a new filter and then change the filter at 50,000 mile intervals or annually. Check for proper part number of filter.

This applies to part numbers 24069 and 24070 filters and requires the use of WIXCool™ Liquid Additive.

To ensure proper coolant conditioner concentration, use WIX Test Kit at intervals of 250 hours or 15,000 miles. When using the test kit, follow maintenance practices outlined in the test kit instruction card. Depletion rate of the WIX Chemical Additive may vary according to engine condition, cooling system condition, engine type or operating condition.

WIX Standard Service Interval (S.S.I.) Cooling System Products

Spin-On Conversion Kit

With our universal mounting base (Part Number 24019) you can either convert existing cartridge style coolant filters to spin-on styles or you can add the protection of a coolant filter to virtually any cooling system. The 24019 kit comes with easy to understand installation instructions. Our product line includes a variety of spin-on filters that can be used with the 24019 kit.

Additive Free Type: 24069, 24070, 24083, and 24084
Additive Type: 24071, 24072, 24073, 24074, 24082, and 24088

For Mack Truck Applications

WIX part numbers 24428 (3/4-20 thread) and 24429 (1-16 thread) are used for MACK brand applications. These filters contain a supplemental chemical additive (SCA) that goes into the coolant solution and deposits a protective coating on all interior metal cooling system components while maintaining the correct pH level and helping to soften the water. These filters are compatible with glycol-based antifreezes, both normal service and extended service types that are either concentrated or pre-mixed.

Part Number 24430 is the additive free version of 24428. Additive free type filters are to be used either in systems where our liquid WIXCool™ SCA is being used or where antifreeze, either new or recycled, with SCAs already in it, is being used. The additive free filters are **NOT** to be used either in systems using just water or just water and antifreeze.

The filter eliminates harmful cooling system contamination. They must be changed in accordance with the vehicle manufacturer's recommended maintenance schedule.

WIX Extended Service Interval (E.S.I.) Coolant Products

Today's cooling system maintenance programs are undergoing some changes from what has been the "traditional" approach. While many fleet maintenance programs still make very efficient and effective use of our Standard Service Interval (S.S.I.) products, which require a service interval of 15,000 miles or 250 hours, some fleets are looking to go to an extended service interval program. To meet the particular needs of an "extended" approach, WIX Filters offers our Extended Service Interval (E.S.I.) products. These products are specifically designed for a service interval of 150,000 miles 4000 hours or 1 year. Maintenance personnel now have the options they need to customize their cooling system maintenance procedures to an interval that fits with the rest of their maintenance program.

Product Usage and Selection Guide

Extended Service Interval (E.S.I.) coolant products are available in both the liquid additive form and the solid, slow additive release form contained in various filter applications. These products are totally compatible with other "extended life/long life" products and with all glycol-based antifreezes, either regular formulas or "fully formatted" types. **No** WIX E.S.I. product is designed for use on or in any cooling system that uses only water.

Liquid E.S.I. Additive and Additive Free Filters

There are two distinctly different ways to use the 1 quart liquid additive, part # 24060 (Please note 24060 is going obsolete and is only available until inventory is depleted) . First, it may be added to a system that has just been drained, cleaned and thoroughly flushed. For a system up to 20 gallons total capacity, 1 quart of E.S.I. additive is all you need. For systems with larger capacities, 1 quart of E.S.I. additive is required for the first 20 gallons and 1 quart per each additional 20 gallon capacity. The fractional breakdown is ½ pint E.S.I. liquid is required per 5 gallons cooling system capacity.

The other way to use the E.S.I. liquid additive is to simply pour it into any cooling system just after a normal maintenance interval service has been performed. The amount of E.S.I. liquid to use is the same as that used in a system that been drained and flushed. From this point on, your system should be treated as an extended life system.

Regardless of how the E.S.I. liquid additive is added to a particular cooling system, we highly recommend the use of an E.S.I. coolant filter on every system to insure all types of solid contamination are removed from the coolant. Part numbers 24083, 24084, 24086, 24091 and 24092 are additive free filters specifically for use on cooling systems utilizing the E.S.I. liquid additive. If a system does not currently have a filter on it now, our part number 24019 add-in coolant filter mounting base kit can be used to add 24083 and 24084 filters to any system.

Extended Service Intervals (E.S.I.) Filters

The use of filters to introduce supplement coolant additives (SCAs) to a cooling system has been very popular for a very long time. If your vehicle is currently using a filter for this purpose or if you would like to add a filter to any system, WIX has the E.S.I. products required for either direct replacement on existing setups or conversion to extended service interval technology.

WIX Extended Service Interval (E.S.I.) filters are designed to last 150,000 miles or 4000 hours or 1 year. Metal component thickness has been increased. Key components have been coated for better corrosion resistance. The media, gaskets, adhesive materials and inner element support springs in these filters are specifically designed to withstand the environment of extended service intervals. WIX E.S.I. filters with extended service interval additives in them are part numbers 24082, 24085 and 24090. The 24082 can be added to any coolant system by using our part number 24019 add-on coolant filter mounting base kit.

The extended service additives in these filters are a patented combination of a controlled solubility, time release coating on the additive pellets and a diffusion orifice to slowly released additives during extended service intervals without adding harmful contaminants to the cooling system. The additives in E.S.I. filters are especially designed to only replace additives depleted with system operation. This minimizes the total dissolved solids (TDS) level in cooling systems. Lower TDS results in better heat transferability of the coolant, reduced water pump leakage and a lower potential for metal pitting corrosion.

WIX also offers two other part numbers for coolant system maintenance. The additives in these two part numbers are more closely related to traditional DCA type SCAs and are designed to replace the slow release ("need") filters. These part numbers are 24088 and 24089. Their design and componentry contains the same durability the E.S.I. filters do. The 24088 can be added to any coolant system by using our part number 24019 add-on coolant filter mounting base kit.

Although E.S.I. technology extends the time between actual service intervals, we highly recommend the periodic physical testing of the coolant to insure the required levels of additive protection is present and the overall condition of the coolant is acceptable for continued use. Periodic additive level protection is accomplished by simply using our 3-way test strips, part number 24105, 24106 or 24107. This type of testing should be done a minimum of two times during the normal E.S.I. service intervals of 1 year, 150,000 miles or 4000 hours of use. A full coolant analysis should be done every 3 years, 450,000 miles or 12,000 hours of service to determine if the coolant is still acceptable for continued use or if the system should be drained, cleaned, flushed and re-charged with E.S.I. additives. An easy to use coolant analysis kit is available from your local WIX Filters District Sales Manager.

Cooling System Maintenance for Heavy Duty Engines

There are many cooling system problems and failures. Most of these problems have occurred due to incorrect information and maintenance practices. The following will address these problem areas by correcting the erroneous information and listing the proper maintenance practices.

The chart shown below is a listing of the six most common problems seen in today's cooling system. Along with each problem is a description of how it occurs, how it affects your engine and, most importantly, how to prevent it.

Problem	How It Happens	What It Can Do	Prevention
*Rust	Oxidation within the system	Clogs the system, causes accelerated wear	The inhibitors in a quality Supplemental Coolant Additive prevent the oxidation for rust to occur.
Scale (Water Hardness)	Present in all tap water are salt minerals, especially calcium and magnesium. These minerals can solidify and adhere to hot metal surfaces.	1. Clog system passages. 2. Deposit on high temperature areas and reduce the heat transfer rate causing hot spots. This results in uneven metal expansion, scuffing, coring, accelerated ring wear and eventually, cracked heads and/or blocks.	The Supplemental Coolant Additive keeps salt minerals in suspension so they cannot deposit on engine metal surfaces or clog passages.
Acidity (pH)	1. Glycol antifreeze reacts with oxygen in the air and forms acid. 2. A loose head gasket or other leakage can allow sulfuric acids formed by the burning of fuel to leak into cooling system.	Corrode iron, steel and aluminum.	A quality Supplemental Coolant Additive neutralizes acids to prevent corrosion.
Pitted Cylinder Liners	Constant vibration of the cylinder liner causes a momentary vacuum to form on its surface. Coolant boils into the vacuum and vapor bubbles implode on the surfaces of the liner, digging into unprotected liners.	Cause pits, which can extend over time, through the thickness of the liner and allow coolant to enter the combustion chamber or crankcase	The Supplemental Coolant Additive coats the liner with a thin film to protect it from cavitation erosion without impeding heat transfer.
Foam	Foam – The aeration of coolant – occurs from air leakage into the system.	Adds to the cavitation erosion problem. Particularly in the areas of water pump impellers.	A quality Supplemental Coolant Additive has an antifoam agent to prevent formation of air bubbles. This foam prevention agent is effective at all temperatures, even during startup.
Pitted Water Pump Impellers	Flow rates and turbulence are high at the impeller blade. This causes cavitation. In addition, there is a possibility that abrasive particles are present in the system.	Cause loss of pump efficiency and total pump failure.	The Supplemental Coolant Additives protect the impeller from cavitation erosion and the filter holds particulate matter to reduce abrasive wear on cooling system components.

*It should be noted that rust can appear even within a chemically protected system when oil is present in the coolant. If you do notice the presence of rust, the oil cooler should be inspected for possible leaks.

Starting Right

Before changing the coolant, the system should be thoroughly flushed to remove any contamination. A clean system is free of solid contaminants and oil.

Make-Up Water

Proper coolant system maintenance requires quality make-up water. All make-up water is corrosive but water with a high mineral content cannot be made fit for use. As soft of tap water as possible should be used. Tap water that has been softened by some type of salt or chloride process should not be used. Most engine manufacturers have set up specifications for water used in their engines. The following chart shows some of these specifications.

	Caterpillar	Cummins	Detroit
Hardness	100ppm	300ppm	170ppm
Chlorides	40ppm	100ppm	40ppm
Sulfates	100ppm	100ppm	100ppm
Total Dissolved Solids	340ppm	500ppm	340ppm

Antifreeze

Antifreeze, glycol, propylene glycol or long life/extended life, should be used in the cooling system year round. The glycol in the antifreeze provides freeze protection. It also provides a stable environment for gaskets and seals. These same gaskets will shrink in straight water and leakage could occur.

Some of the major problems we see in cooling systems today occur due to antifreeze related problems. One of the most publicized problems is silicate gelation/dropout. Silicate gel problems have increased in frequency since the early 1980's. The two major causes of this problem are:

1. High Silicate Antifreeze
2. Over-concentration of antifreeze and/or Supplemental Coolant Additives.

All antifreezes used in today's heavy-duty engines should meet GM 6038M or ASTM D-4985 specifications for silicate content. The antifreeze concentration should be held between 40% and 60% (40% antifreeze and 60% water to 60% antifreeze and 40% water). A 50% blend is ideal. The use of a refractometer or hydrometer will insure the glycol concentration levels are maintained properly.

Another problem caused by over concentration is water pump leakage. In a study by Cummins Engine Company, 54% of the water pump failures they examined occurred due to over concentration. 78% of the total pumps examined showed over concentration regardless of the cause of the failure.

Using the proper amount of a high quality Supplemental Coolant Additive (SCA) is very critical in preventing the problems mentioned in the chart on the previous page. When filling a cleaned system with fresh antifreeze and water, a Supplemental Coolant Additive (SCA) is required. These additives may contain inhibitors not found in today's antifreeze.

When pre-charging, be sure to use the proper pre-charge filter for your size cooling system or 4 ounces (120 ml) of liquid Supplement Coolant Additive (SCA) per gallon (3.8ltr) of coolant (4 ounce [120ml] requirement based on the most common Supplemental Coolant Additive). In either case, be sure to follow the Supplemental Coolant Additive (SCA) manufacturer's specifications.

Service

Supplemental Coolant Additives (SCA) are used up (depleted) while in the process of protecting the metal surfaces which are in contact with the coolant. These additives must be replenished through the use of filters containing SCA's or a liquid SCA at specified intervals to maintain the proper concentration levels.

Periodic Draining and Flushing

Antifreeze breaks down to corrosive acids due to temperature cycles within the cooling system. The coolant can also become contaminated by dirt, oil combustion gases and spend inhibitors. While a high quality coolant filter will remove the solid contaminants, it will not remove the oil or combustion gases. Due to the breakdown of the antifreeze, all engine manufacturers recommend periodic draining and flushing. Caterpillar and Detroit Diesel recommend annually draining and flushing while Cummins and Mack recommend a maximum of two years.

There are many specialized products on the market today which can help you develop a quality cooling system maintenance program. The antifreeze concentration level is a key area which could lead to silicate gelation and water pump leakage. The recommended range is 40 – 60% based on ambient temperature. The use of a refractometer or hydrometer will insure the glycol concentration levels are maintained properly.

There are several types of Supplemental Coolant Additive test kits on the market. The primary types check one or more of the following:

1. Sodium Nitrite
2. MBT
3. pH

Use the test kit recommended by your Supplemental Coolant Additive (SCA) supplier. CAUTION: Test strips or testers which register the pH as the sole determining factor in adding your Supplemental Coolant Additive (SCA) should not be used.

Information About Antifreeze (Glycol)

Ethylene (EG) & Propylene (PG)

Traditional: Inorganic Acid Technology (IAT)		Extended/Long Life: Organic Acid Technology (OAT)	
Automotive	Heavy Duty	Automotive	Heavy Duty
Automotive/Conventional Traditional coolant formulated to provide protection for automotive gasoline engines. Mixture includes high levels of silicates to protect aluminum parts in automotive engines. May also contain phosphates. Not suitable for use in heavy medium duty diesel engines. No SCA used with this type of coolant.	Standard Service Interval (S.S.I.) No to very low levels of silicates. Not suitable for use in automotive gasoline engines. Must use SCAs. Often labeled as a Fleet or Heavy Duty coolant. Intended to provide corrosion protection only when used and maintained with SCAs. Requires Pre-Charge of SCAs to establish proper inhibitor levels, followed by lower doses of SCAs in a Maintenance amount. SCAs are available in both liquid and dry form. Manufacturer's recommendations for Pre-Charge and Maintenance doses and intervals must be followed. Requires SCA testing.	Organic Acid Technology OAT Formulated with ethyl hexanoic acid as its chief organic inhibitor. It does not use any traditional buffers thus it is commonly called a full OAT coolant. i.e. Dexcool. No additional SCAs used with this coolant.	Nitrited Organic Acid Technology NOAT Organic Acid based glycol coolant formulated with traditional buffers and corrosion inhibitors. Nitrite is a key corrosion inhibitor/buffer. Requires organic acid booster at the half way point of its recommended service interval. No additional SCAs, either liquid or dry, are to be used with this coolant. No SCA testing.
	Pre-Charged Standard Service Interval (S.S.I.) Traditional HD coolant with low to no levels of silicates premixed with a Pre-Charge level of SCAs and deionized quality water. No additional charge of SCAs should be used on Initial installation. Does require Maintenance dose of SCAs thereafter. Requires SCA testing.	Hybrid Organic Acid Technology HOAT Formulated with both organic inhibitors plus strong buffer compounds. Often uses borates one of the buffer compounds. As a mixture with traditional buffers and OAT inhibitors, this coolant is called a Hybrid thus the acronym HOAT. i.e. G-05 Gold Some HOAT coolants also incorporate nitrite buffer compounds and are recommended by their manufacturer for use in light duty to medium duty diesel engines. No additional SCAs used with this coolant.	Partial Organic Acid Technology POAT Organic Acid based glycol coolant formulated with additional buffers and corrosion inhibitors. No additional SCAs, either liquid or dry, are to be used with this coolant. No SCA testing.
	Slow Release Service Interval (S.R.I.) Specially formulated SCA package that releases over time. Used with traditional low/no silicate coolant to extend the maintenance service intervals. Requires SCA testing.	Partial Organic Acid Technology POAT Organic Acid based coolant formulated for use in automotive engines with high levels of aluminum parts. Developed to be more compatible with seal and system components. Not suitable for use in medium or heavy duty diesel engines. No additional SCAs used with this coolant. Often premixed with deionized water.	Nitrite, Amine, Phosphate, Silicate Free NAPS Organic Acid based glycol coolant formulated with additional buffers and corrosion inhibitors. No additional SCAs, either liquid or dry, are to be used with this coolant. No SCA testing.
	Extended Service Interval (E.S.I.) Specially formulated SCA package that requires less maintenance over time. Used with low/no silicate coolant to extend the maintenance service intervals. Requires SCA monitoring and maintenance.

Adapters for Converting Engine Mounted Filters To Remote Mounted Base

These cast aluminum adapters are designed for converting engine mounted spin-on oil filters to remote mounted spin-on filters. Each adapter has a female thread to mate with the engine male thread stud. Two 1/2" N.P.T. female threaded ports are used for connecting the flexible oil lines. O-ring sealing gaskets are included with each adapter.

Cast aluminum adapter for converting canister type filter on 1956-67 Chevrolet V-8 and 1958-69 Chevrolet/GMC truck V-8 engines to remote mount spin-on filter. Adapter replaces all canister filter components including the bypass valve assembly. A spin-on filter with bypass valve must be used on the remote base. Adapter comes with gaskets, two 1/4"-20 bolts for passenger car engines and two 5/16"-18 bolts for truck engine. Two 1/2" N.P.T. female threaded ports are used for connecting the flexible oil lines.

24766	Length – 4.230" Width – 3.500" Height – 1.860"	13/16" – 16	1/2" N.P.T. Female
24081	Length – 4.060" Width – 3.090" Height – 1.870"	1" - 12	1/4"-18 N.P.T. Female
24768	Length – 4.090" Width – 3.100" Height – 1.810"	1" – 12	1/2" N.P.T. Female
24023	Length – 4.050" Width – 3.090" Height – 1.870"	1" - 14	1/4"-18 N.P.T. Female
24770	Length – 4.090" Width – 3.100" Height – 1.810"	1" - 14	1/2" N.P.T. Female

Note: When remote mountings are used for spin-on lube, hydraulic and transmission applications, **the system must be protected with a bypass relief valve.** The lube and hydraulic filters listed all have built in bypass valves.

Caution: When selecting a filter for use on these remote bases, size, flow rate and performance characteristics must be considered.

Lube Filter Conversion Kits

Bypass Filter for Small Gas and Diesel Engines

Small engines equipped with cartridge type bypass filters can be converted to the convenience of a spin-on with this kit. The kit may also be used to add on supplemental bypass filtration to provide increased engine protection. A choice of three different sized filters is available.

Bypass Filter for Large Gas and Diesel Engines

Conversion Base

With our Part No. 24750 you can convert old-fashioned pot type element housings to the convenience of spin-ons. You save time and money during filter changes and eliminate the cleaning of messy pots. May be used on any diesel engine including Detroit Diesel, Cat, Mack, IHC, etc.

Spin-On Bypass Lube Filter

The WIX 51749 filter ends the mess and wasted time in servicing your equipment. Easy to convert...easy to service...saves dollars in service time and down time. The WIX 51749 exceeds the performance requirements for the Cummins Diesel Engine specifications. WIX has designed the 51749 using the same special top quality premium grade of paper, as you would find in all our heavy-duty lube filters.

Note to Cummins Owners

As of May 1982, Cummins is manufacturing engines with a 9-gallon oil pan using the spin-on type bypass filter. Remember, Cummins Engine Company requires that 51749 retrofits, for on-highway applications, retain the 750-bypass housing, which will act as an oil reservoir. Off highway applications may use the spin-on bypass filter in place of the housing.

Double Protection Oil Analysis System

24077

24078

24290

Simply order the WIX Filters Double Protection Oil Analysis Kit you need.

Part No. **24077** - Contains sample bottle for used oil, request sheet and mailer container. Instructions included.

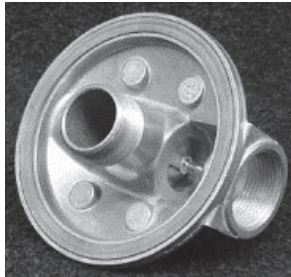

Part No. **24078** - Contains sample bottle for used oil, request sheet, mailer container and section of 1/4 inch plastic tubing. Instructions included.

Part No. **24290** - Contains a section of 1/4 inch plastic tubing and suction pump. Instructions included.

Be sure to follow the directions thoroughly in filling out the request form and obtaining the oil samples. Analysis for wear metal concentration can be evaluated and wear rates determined only if all pertinent information necessary for analysis is available. To help us better evaluate your vehicles' used oil, the request sheet must be accurately completed. Only with all of this information can precise determinations of wear rates be made. Since concentrations of suspended materials are not necessarily the same throughout the lubricating system, proper sampling techniques must be employed (sampling instructions are provided on the back of the request form). In fact, improper sampling procedures can lead to misleading results.

Hydraulic systems require fluid for efficient operation and long component life. These adapter bases and hydraulic filters are ideal for use on log splitters, farm and construction equipment, lift trucks or anywhere a filter is not currently being used. **CAUTION:** The base and filter **MUST** be installed in the return line (low pressure) to the fluid reservoir.

For fluid flow rates up to 12 gallons per minute, with a maximum working pressure of 100 psi, the following adapter bases and filter can be used. **NOTE: The filter bypass (7-9 psid) valve is located in the filter.**

Replacement Gaskets

Correct gasket type, size and placement is necessary to ensure that a proper seal is formed during filter installation. Typically, the gasket(s) is included with the filter when it ships from the manufacturer. However in some instances, the filter is used on many different applications and it would not be practical to include all gaskets for all applications. Instead the gasket(s) required for the most common applications are included and others are made available separately. As stated earlier, it is critically important that the correct gasket be used when servicing a filter. Always compare the provided gaskets with the one taken out of service to ensure that they are correct matches. If this is not the case, a different gasket may be required for your application. On-line cataloging resources can help you determine which gasket is appropriate for your application.

Lube & Hydraulic Filters 5" OD Multiple Gaskets Available				
Part No.	Packed	Packed	Special	Special
51632	15661	15658		
51746	15386		15661	15859
51756	15415		15661	15658
51758	15758		15661	15658
51759	15415		15661	15658
51860	15415		15661	15658
51861	15661	15415	15658	

For example, WIX part number 51759 ships with a 15415 gasket included. However, gaskets 15661 and 15658 are also available for use with this filter.

Gasket Diameters			
Number	O.D.	I.D.	Thk.
15415 (Packed)	5.14 (131mm)	4.75 (121mm)	0.195 (5mm)
15658	5.055 (128mm)	4.48 (114mm)	0.359 (9mm)
15661	5.03 (128mm)	4.44 (113mm)	0.19 (5mm)

In this particular instance, the gasket that ships with the product (15415) is used on a mounting base that has a narrow groove. Gasket (15661) is intended for an application on which the mounting base has a wider groove. Gasket (15658) fits yet another application for which the base has no groove. In this instance, the gasket (15658) is L-shaped and significantly different from the other two.

Unintended loss of fluid can lead to catastrophic equipment failure. Choosing the correct filter and the right sealing gasket is critical for proper function and protection of your equipment. Always take the time to be certain that you have correctly matched the application to the filter and the filter to the correct gasket.

As a reminder, it has always been, and remains our recommendation that the selection of a replacement filter be conducted using only the most current application information available. In today's cataloging, the electronic resources (i.e. Internet, interactive electronic) would be the most current application information available. Wire Mesh In-Tank Hydraulic Filters

These filters feature:

- 100 mesh cleanable stainless steel wire cloth media
- Built-in bypass valve protection set at 3 psid
- Flow capacities rated at 5fps (feet per second) outlet line velocity with pressure drops of less than .5 psi
- Element endcaps utilizing a reversed taper on the outside diameter and epoxy sealant to prevent bonding failures, even when used on rough terrain applications
- Compatibility with all petroleum based oils, fire resistant hydraulic fluids, coolants and lubricants

Installation Instructions

Installation of AquaChek filters requires a filter mounting base (see above chart for proper base + filter) and tools to cut and thread the airline at the location the filter mounting base is being installed. It is recommended that a self-venting water trap be installed between the air compressor and the AquaChek mounting base and filter. This will prolong the life of the AquaChek filter. **Important: The AquaChek mounting base must be installed a minimum of 10 feet away from the compressor.** This allows the air to cool enough to achieve maximum moisture removal. It is vital that the inlet and outlet sides of the mounting base be installed with the proper configuration. It is recommended a flow control valve be installed just before the filter to prevent possible polymer migration. **Change Out Circuit:** In situations where taking the compressor off line for filter changes is undesirable, the installation of an isolation circuit around the filter system is recommended. The isolation circuit requires 2 two-way valves installed to allow routing of air around the filter system during filter change-outs. **Note:** Apply thread-sealing tape to all male thread surfaces when installing the AquaChek base and filter. See our AquaChek website for more complete information and installation instructions at: www.aquachekfilters.com.

ACG1 1 – Differential pressure gauge specifically designed for use on ACKG15, 25, 35, 45 kit bases only. The ACG1 gauge **cannot** be used on the mounting bases in our ACK10, 20, 30 or 40 kits.

The ACKG1 is an easy way to read differential pressure gauge that will indicate exactly when it is time to change the AquaChek air-drying filter. This assures optimum protection and performance.

Industrial Breathers: Clean Dry Air

Disposable Stationary Applications:

The W05AX Series breathers are constructed of industrial grade raw materials. The materials are tested to ensure a wide range of chemical compatibilities. The W05AX Series features high impact resistant ABS top and bottom caps. The clear acrylic tube make it easy to inspect the condition of the color-changing silica gel from a distance. The silica gel turns from gold to dark green to visually indicate the adsorption of moisture and to confirm that the breather is getting the job done.

Ideal For:

- Storage Tanks
- Fluid Reservoirs
- Transformers
- Pumps
- Gearboxes

High Humidity / High Dust Breathers:

W07AX Series breathers are the perfect solution for high humidity and high dust environments. The W07AX Series incorporates 2 check valves and a reusable top cap. The valves provide a closed system until airflow is required, extending the service life of the desiccant.

In addition to having a rugged design, W07AX Series breathers include a top cap that can be reused when the desiccant is spent. The rebuildable design allows for easy replacement of the desiccant cartridge.

Ideal For:

- Paper Mills
- Wash-Down Areas
- Steam Cleaning Areas
- Mines & Quarries

High Vibration Shock Resistant Breathers:

W06AX Series breathers are ideal for these high vibration, mobile applications, including off-road, construction and farm vehicles. W06AX Series desiccant breathers are easily mounted in place of standard breather caps via rugged steel pipe threads and a reusable metal base.

When the gold silica gel cartridge turns dark green, simply install a new replacement cartridge to keep things moving.

Ideal For:

- Cranes
- Railroad Maintenance of Way Equipment
- Farm
- Construction
- Off-Road Trucks and Equipment

Limited Space Applications:

W08AX Series breathers are designed for applications where space is limited or air flow requirements are below 10 cubic feet per minute (CFM). The W08AX Series are typically used on gearboxes and low fluid volume applications. When there are mounting space limits or when a larger breather is not needed, the W08AX breather is the right choice.

Ideal For:

- Gearboxes
- Drums
- Totes
- Small Oil Containers

W10AX LONGER LIFE Premium Breather

The W10AX Premium Desiccant Breather Series offers several advantages over other constructions. Longer life, Check Valve Technology, an Isolation Valve, and a 2 Micron solid particulate filter make this series suitable for a wide range of uses including fume emitting applications. Reusable top and bottom caps readily accommodate replacement cartridges making the W10AX Breather Series a cost effective, efficient option for both solid contaminant and moisture control.

The breather's color coded guide along with the clear acrylic tube makes it easy to monitor the condition of the color-changing silica gel. This feature, along with the easy screw in/out replacement cartridges, make servicing the product a snap!

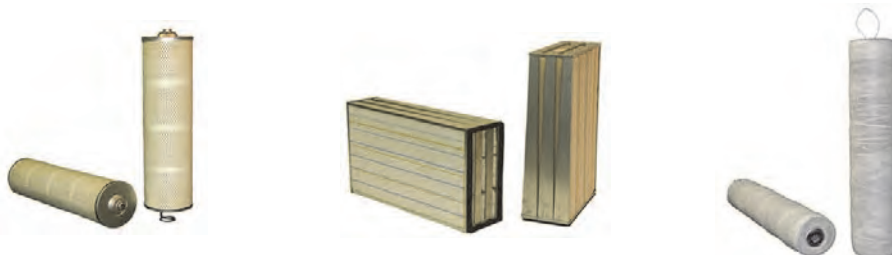

Ideal For:

- Storage Tanks
- Fluid Reservoirs
- Transformers
- Pumps
- Gearboxes
- Recommended for Gas, Bio-Diesel, and Diesel Tanks below 20k Gallons.

PRODUCT NEWS BULLETIN

When highly pressurized combustion gases are blown by the piston rings and into the crankcase, they are commonly referred to as “Blow-By”. This process can heavily contaminate the gases making them unfit for release into the atmosphere as a system exhaust. A **Crankcase Ventilation System (CCV)** routes the gases through a filtering process to purge them of oil residue and other contaminants before they are either recirculated back into the combustion process or released into the air. WIX Filters now offers replacement elements for the Racor® style CCV Systems.

Over Pressurized Lube Oil Filters

From time to time every filter manufacturer has had a filter that has been severely over pressurized returned from a customer. Often the deformed filter is the only sign the car owner has that a problem existed in their lube oil system.

It's possible that the damaged filter was not noticed until it was removed during the next scheduled oil change. However, if the pressure was sufficient to blow out the gasket or unroll the lockseam, the car owner may have experienced immediate and costly problems.

With the "evidence" in their hands, they tend to put the blame on the damaged filter. It's not surprising that they are more than a little aggravated when the filter manufacturer denies any responsibility for the damage. What, then, has caused the over pressurization?

A look at how a lube oil system functions will show that oil pressure is created by the oil pump. The upper limit of this pressure is controlled by a pressure regulating valve which is usually an integral part of the pump. Figure 1 is a simplified diagram of the lube oil system showing the pump, regulating valve, filter and bearings.

The pump supplies sufficient flow to lubricate the bearings and other moving parts of the engine. This oil must be under pressure if it is to properly separate the highly loaded parts of an engine and prevent excessive wear. The purpose of the regulating valve is to provide this pressure which on most passenger cars is between 40 PSI (280 kPa) and 60 PSI (410 kPa).

The regulating valve is made up of a ball or plunger which regulates pressure with the aid of a spring. The spring is calibrated so that the plunger will lift off its seat when the oil pressure reaches the desired amount. Once the valve is open, the pressure remains fairly constant with only small changes occurring as the engine speed varies.

The filter and all other components in the lube system are subjected to the pressure established by the regulating valve. If this pressure is excessive, filter damage may occur. This is the point that many people who are not familiar with lube systems fail to realize.

What can cause the pressure in the system to exceed the regulating valve setting? The answer is that either the valve must be stuck in the closed position or it is sluggish and slow to move to the open position after the engine has started.

Over Pressurized Lube Oil Filters

Normal operating pressure causes no permanent deformation of the filter body. When the system pressure reaches 150 PSI (1,000 kPa) due to a faulty regulating valve, most filters become permanently deformed. At this pressure the gasket usually will not blow out and the lockseam will remain sound.

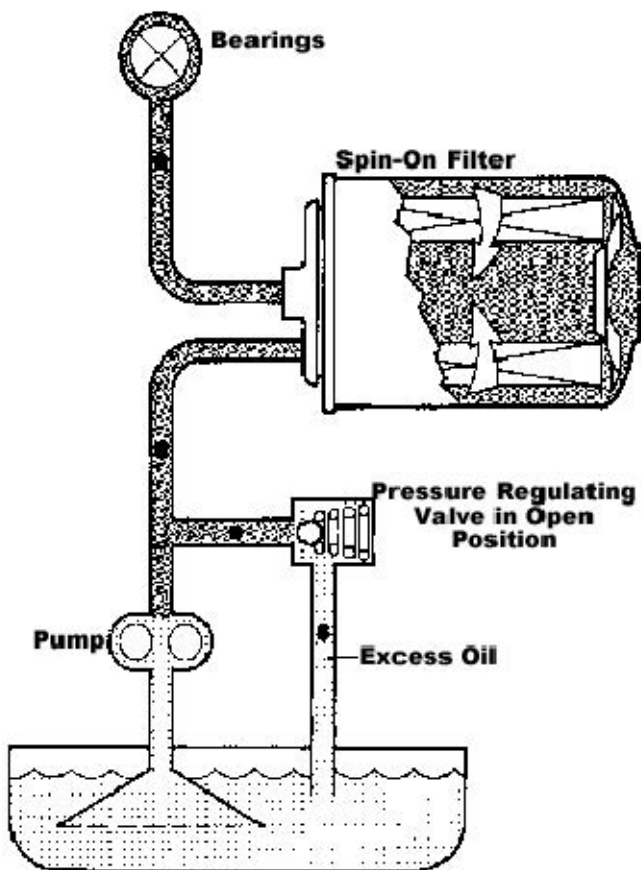

If the regulating valve still remains stuck, the pressure will increase further and the gasket between the filter and the base can be blown out. This will probably cause the loss of all the oil in the system. If the filter has been installed on the tight side, the gasket may not blow out and the lockseam will unwind as the pressure continues to rise. The main point is that the deformed filter is not the cause of this excessive pressure, but is the victim of a faulty regulating valve.

If the customer is alert and shuts the engine off at the first sign of trouble (red light on or reduced oil pressure) they can limit their loss to a tow job, oil change, new filter and oil pressure regulating valve inspection. If the vehicle continues to be driven, engine failure is probable.

The customer may ask if a plugged filter could have caused the over pressurized condition. The answer is no; if the regulating valve is functioning properly it will maintain the pressure on the filter at 40 PSI (280 kPa) or 60 PSI (410 kPa) even if the filter is plugged.

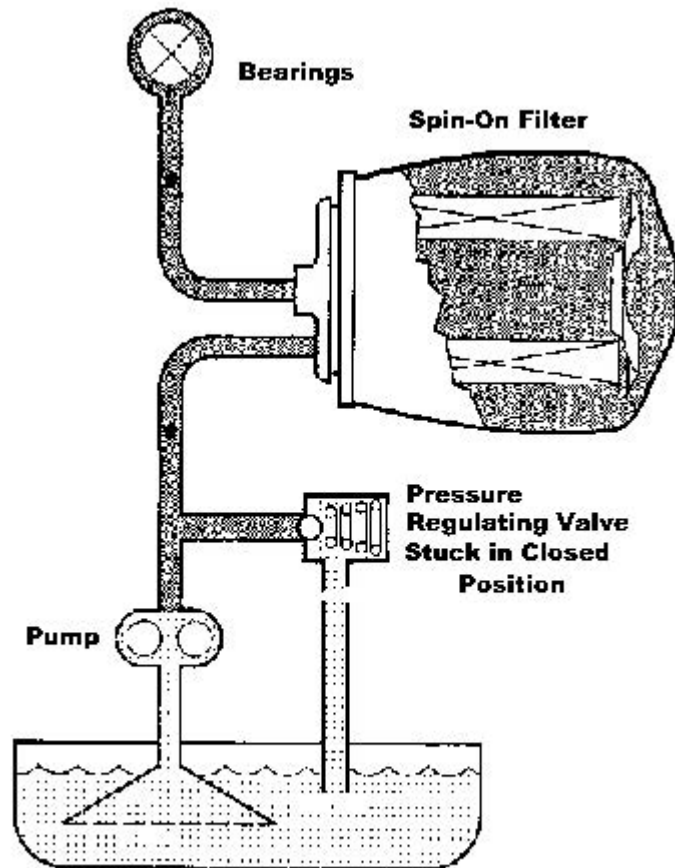

In summary, if a lube filter distorts due to excessive pressure in the system, the fault lies with the oil pump pressure regulating valve and not with the filter.

Diagnosing Engine Oil Filters With Collapsed Center Tubes

When a collapsed center tube or element is discovered, the natural tendency is to assume something is wrong with the filter (Fig. 1). This is not the case, but is a symptom of problems with internal engine components.

Most engines incorporate within the oiling system a by-pass valve across the inlet and outlet of the full flow oil filter. The valve is designed to open and by-pass oil around the filter and/or element when the restriction reaches its opening pressure (Fig. 2). The by-pass flow circuit insures oil flow to the engine when there is a significant restriction across the filter due to plugging or cold start conditions. Typically, engine manufacturers design by-pass valves to open at a pressure differential of approximately 10 to 30 psid (pounds per square inch differential) with some as low as 4 psid (28 kPad) (kiloPascal differential), with some opening as high as 75 psid (500 kPad). Some engine manufacturers have the by-pass valve located in the filter mounting base on the engine, while others locate the valve in the filter. Either way, the same purpose is served.

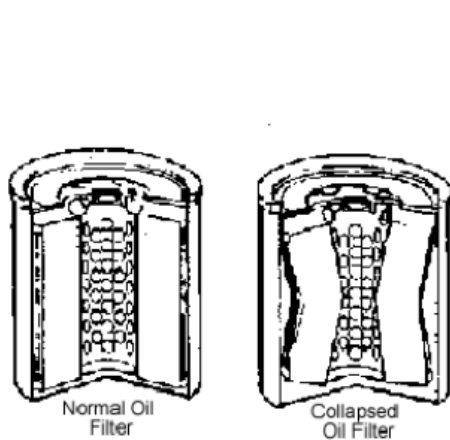

FIGURE 1

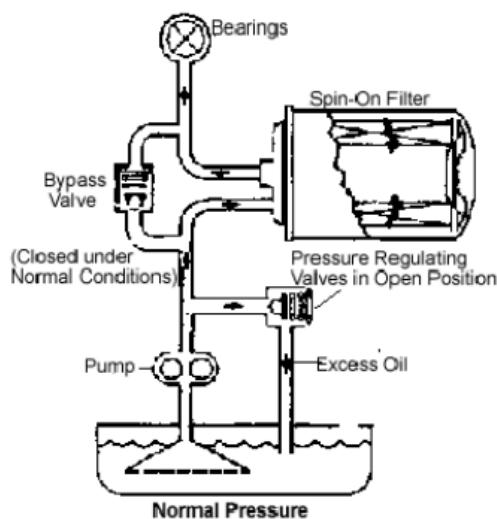

FIGURE 2

Oil filters are designed to withstand, without collapsing, differential pressures significantly greater than those experienced under normal operating conditions.

Diagnosing Engine Oil Filters With Collapsed Center Tubes

Therefore, when a center tube or element has collapsed, it is usually the result of a "sticking" or otherwise malfunctioning by-pass valve.

A collapsed center tube or element can lead to a loss of filtration and oil flow to the engine. There is the possibility that interior parts of the filter or filter media may be physically displaced and could migrate into the oiling system interfering with the oil flow.

The malfunction of the filter by-pass valve, as well as the subsequent collapse of the center tube or element, may not be visually apparent. However, a catastrophic failure of the engine may result due to the seizure of a piston, connecting rod, or main crankshaft bearings among other failure possibilities.

The malfunction of filter by-pass valves and pressure regulating valves has been traced to:

- sticky surfaces caused by cold, highly viscous oil;
- oil contaminated by excessive condensation, coolant, or oxidation;
- improper oil drain and filter change intervals;
- carbon grit that temporarily jams a valve;
- sudden acceleration of the engine with any of the above conditions.

An oil filter with a collapsed center tube or element indicates a malfunction within the system. Inspection of the system and a review of the engine's performance and maintenance history should be conducted.

Solving Winter Diesel Fuel / Fuel Filter Problems

Engine Power Loss

Diesel engine power loss during winter operation is a common occurrence and source of complaint. Unless there is a component failure within the engine, the problem can usually be traced back to paraffin crystal formation in the fuel which restricts flow through fuel filters. Freezing temperatures can also cause any emulsified water to form a fuel/ice slush, further restricting filters. Frequently, fuel filters are blamed for the problem when, in fact, the problem is caused by the effect of cold weather on summer grade #2 diesel. (Refer to FAQ: Heavy Duty – Diesel Fuel Filtration)

The Cloud Point is the temperature at which paraffin, which is naturally present in #2 diesel fuel, begins to form cloudy wax crystals. When the fuel temperature reaches the cloud point, these wax crystals flowing with the fuel coat the filter element and quickly reduce the fuel flow, starving the engine. Typical cloud point temperatures range from: -18°F (-28°C) to +20°F (-7°C), but may occasionally be as high as +40°F (4.4°C). #1 diesel fuel (or kerosene) contains very little paraffin, and therefore has cloud and pour points near -40°F (-40°C).

The Pour Point is the temperature at which the paraffin in the fuel has crystallized to the point where the fuel gels and becomes resistant to flow. Pour points also vary but they usually occur from 10°F (5.6°C) to 20°F (11.1°C) below the cloud point.

Solving the Problem

As long as #1 diesel or a winterized diesel blend is used during winter conditions, most fuel related winter problems can be avoided. However, encountering poor quality or unconditioned fuel is inevitable, so some precautions should be made when operating in cold weather. Depending on the severity of winter operating conditions, many operators may choose to protect their equipment through the use of fuel additives, fuel heaters, and fuel water separators.

A Word of Caution: Never add gasoline or alcohol to diesel fuel to help with cold weather operation. The practice creates an explosion danger and will damage the fuel injection system.

Cold Flow Improvers

The only way to actually lower the cloud point temperature is to dilute #2 diesel with #1 diesel or kerosene. However, this lowers the fuel heat value and can be an expensive solution. Alternately, widely available cold flow improvement additives may help delay filter plugging. They lower the pour point of diesel fuel several degrees, but do not change the cloud point temperature. Instead, cold

Solving Winter Diesel Fuel / Fuel Filter Problems

flow improvers work by altering the paraffin crystal shapes to needle-like forms. More of the needle-shaped crystals can pass through the filter element, slowing the plugging process.

Fuel Heaters

Heating diesel fuel above the cloud point can help avoid winter engine power loss. There are three common sources of heat energy that are available for fuel heating: electric heaters, engine coolant and return fuel heaters.

Electric Heaters come in two types, Positive Temperature Coefficient (PTC) and resistance. Because of on-vehicle power limitations, electric heating cannot sufficiently heat high fuel flows. However, if paraffin wax begins to plug the fuel filter, the flow through the filter begins to slow until the flow rate is low enough for the fuel heater to be effective, and the filter can still pass sufficient fuel to allow the engine to run and warm. This flow may not be sufficient to run the engine under load.

PTC heaters use disc-shaped heating elements that are attached to a heat sink plate which transfers the generated heat to the flowing diesel fuel. They are most effective when fuel is constantly moving over them to take the heat away. When flow stops and/or the temperature rises, PTC heaters will self regulate to a lower current draw.

Resistance heaters are like the heating elements used in kitchen ranges. These produce constant heat whether the fuel is moving or not. Blanket or wrap-around supplemental heaters are available that can be fastened to the outside of filter housings for severe weather conditions. These, however, are only energized when the vehicle is parked. They operate on 110 VAC along with engine block and tank heaters and allow easy start up in cold weather.

Engine Coolant is another source of heat energy that, through the use of a heat exchanger, can transfer excess cooling system heat to the fuel. In conjunction with electric heat at engine startup, a coolant/fuel heat exchanger can supply an enormous amount of heat to the fuel, effectively eliminating any chance of cold fuel filter plugging.

Return Fuel Heaters work by allowing the engine heated "return fuel" to enter back to the inlet side of the filter instead of directly back to the fuel tank. The warm return fuel makes up a major portion of the inlet fuel, reducing the amount of cold fuel supplied from the tank. A thermally controlled valve diverts all the return fuel to the fuel tank when the fuel in the tank is warm.

Diesel Fuel Contamination and Fuel Filter Plugging

Fuel contamination is a fact of life. Preventing problems and equipment damage associated with contaminated fuel is primarily the responsibility of the end user. These responsibilities include the proper and timely replacement and servicing of the filters; selection of the fuel source, grade, and blend; and use of heaters, separators, and additives as required. (Refer to TSB 07-1 and TSB 07-2)

Fuel filters capture unwanted contaminants from the fuel. Left unchecked, these contaminants may cause serious and expensive damage to many system components including pumps, lines, and injectors. Fuel contaminants have many sources. Most sources are external to the fuel system itself, that is, most contaminants come with the fuel that is delivered to the fuel tank. As it comes from the refinery, diesel fuel is generally clean. Contaminants in diesel fuel are typically introduced in fuel storage systems through mixing, transferring, and storage.

Fuel filters, by design, become more restrictive to the flow of fuel as they go about their job of removing contaminants from the fuel system. Fuel systems, unlike lube systems, do not have the opportunity for bypass flow and consequently, as flow through the fuel filter becomes severely restricted or plugged, loss of engine power will result. A thorough investigation of the filter and the fuel source should be conducted anytime a fuel filter is suspected of delivering less than its expected life.

Some common contaminants found in today's fuels might include:

Water -- is the greatest concern because it is the most common form of contaminant. Water may be introduced into the fuel supply during fueling when warm, moisture laden air condenses on the cold metal walls of fuel storage tanks or from poor housekeeping practices. The effects of water in diesel fuel can be serious. Water can cause damage to injector components and reduce the lubricity of the fuel which can cause seizure of close tolerance components such as those found in fuel pump assemblies.

Diesel Fuel Contamination and Fuel Filter Plugging

Water can be removed from diesel fuel by using in-line water separating filters or devices. Long term prevention of problems associated with water in fuel is best accomplished by obtaining fuel from reputable suppliers capable of providing high quality fuel. Further, tanks should be kept as full as possible to prevent condensation. Fuel should be drawn from the top of a storage tank if possible, as water is heavier than diesel fuel and tends to settle to the bottom of tanks. Tanks can also be kept free of water with continuous off-line or "kidney-loop" filtration/separation.

Fungus and Bacteria -- live in water and feed on the hydrocarbons found in fuel. Often called Humbugs for short, these active and multiplying colonies will spread throughout a fuel system and quickly plug a fuel filter. The fuel filter will have a slime-like coating over the surface of the media, dramatically reducing the service life of the filter. Bacteria may be any color, but are usually black, green or brown. Draining the system will reduce microbial activity, but will not eliminate it. The only way to eliminate microbial growth once it has started is to clean and treat the system with a biocide.

Wax -- is desirable as a source of energy in fuel, but control in cold weather operation is needed. Wax crystals form as a result of cold temperature precipitation of paraffin. Temperatures below a fuel's cloud point will result in wax precipitation and filter plugging. To prevent plugged filters due to wax formation, the cloud point of fuel must be at least +12° Celsius (+22°F) below the lowest outside temperature. Fuel suppliers blend diesel fuel based on local anticipated cold weather conditions. Particular attention should be given to diesel fuel purchased outside your local area. For example, fuel purchased in the West or South may not be suitable for operating conditions in the Midwest or North.

Asphaltenes -- are by-products of fuel as it oxidizes. Asphaltene particles are generally thought to be in the 0.5 – 2.0 micron range and are harmless to the injection system, as they are soft and deformable. As these tiny particles pass into the filter media they tend to stick to the individual fibers. If you were to examine the media of a fuel filter that had been exposed to asphaltenes (oxidized fuel), you would see a black, tarry substance on the dirty side of the element. Fuel with a high percentage of asphaltenes will drastically shorten the life of a fuel filter.

Sediment and other solids -- often get into fuel tanks and can cause problems. Most sediment can be removed by settling or filtration. Fuel filters designed for specific applications will remove these contaminants before they cause fuel system damage.

Diesel Fuel Contamination and Fuel Filter Plugging

In no case should a less efficient filter be substituted to fix a perceived problem with premature plugging. Restriction will increase as the filter works to remove unwanted contaminants from the fuel system. Filter manufacturers design fuel filters to provide the level of filtration protection specified or required by the OEM manufacturer. Substitution of a less efficient filter may prolong a filter's life before plugging occurs, but it will also allow contaminants to pass downstream which will eventually impact the life of other, more expensive fuel system components. (Refer to TSB 89-5)

Clean fuel is essential for efficient, optimum engine performance. Remember, newly refined fuel is generally clean. Between the time the fuel leaves the refinery and enters the engine's fuel tanks, it should be handled carefully to avoid possible contamination that can prematurely plug fuel filters and cause even further, more serious damage within the engine's fuel system.

Manufacturers' Warranty

Consumer purchasers of filters are sometimes told that an aftermarket brand of replacement filter cannot be used in the consumer's vehicle during the warranty period. The claim is made that use of an aftermarket brand will "void the warranty," with the statement or implication that only the original equipment brand of filters may be used. This tends to cast doubt on the quality of the aftermarket filter.

That claim is simply not true. If the consumer asks for the statement in writing, they will not receive it. Nevertheless, the consumer may feel uneasy about using replacement filters that are not original equipment. With the large number of consumers who prefer to use an aftermarket filter this misleading statement should be addressed.

Under the federal Magnuson-Moss Warranty Act, the Clean Air Act and general principles of the U.S. Federal Trade Commission Act, a manufacturer may not require the use of any brand of filter (or any other article) unless the manufacturer provides the item free of charge under the terms of the warranty.

If the consumer is told that only the original equipment filter will not void the warranty, they should request that the OE filter be supplied free of charge. If they are charged for the filter, the manufacturer may be violating the Magnuson-Moss Warranty Act or other applicable law.

By providing this information to consumers, the members of the Filter Manufacturers Council (FMC) intend to combat the erroneous claim that the use of a brand of replacement filter other than original equipment will "void the warranty."

It should be noted that the Magnuson-Moss Warranty Act is a U.S. federal law that applies to consumer products. The U.S. Federal Trade Commission has authority to enforce the Magnuson-Moss Warranty Act, including obtaining injunctions and orders containing affirmative relief. In addition, a consumer can bring suit under the Magnuson-Moss Warranty Act.

Limited Warranty

FILTERS

Any vehicle and equipment warranties you may have are not affected by proper use of WIX filters.

MANN+HUMMEL Filtration Technology US LLC ("we") warrants your WIX filter to be free from defects in materials and workmanship during the Warranty Period. The "Warranty Period" is the service interval for filter replacements recommended by the manufacturer of the engine or equipment. If your filter is found to be defective during the Warranty Period, we will, at our sole discretion, replace it with another WIX filter and/or reimburse you for the reasonable costs of the parts and labor required to repair your engine or equipment to the extent the damage is solely attributable to the defective filter.

If your application is not listed in the WIX catalog, this limited warranty applies ONLY if your filter is a valid cross-reference to the proper OEM filter as listed in the wixfilters.com online filter lookup, the WIX Filters app, the printed catalog or its electronic copy. It is your responsibility to determine the proper OEM filter for your application and the correct WIX cross reference to the OEM filter in the online filter lookup. We reserve the right to examine the filter, engine and/or equipment to verify the applicability of the cross-referenced OEM filter.

NON-FILTER PRODUCTS

Products other than filters are warranted to be free from defects in materials and workmanship for a period of one (1) year from the date of purchase.

WARRANTY SERVICE

To obtain warranty service, you must, within 30 days after discovery of damage, submit a claim to any WIX representative, your WIX distributor or directly to the address below. We reserve the right to examine the filter, engine and/or equipment to determine the extent of damage and whether it was caused by a defective WIX filter. We also reserve the right to examine any applicable service records, installation records, and receipts.

CONDITIONS

For filters, this limited warranty DOES NOT COVER:

- Filters submitted in a condition that prohibits evaluation and testing, such as a filter that has been deconstructed, disassembled or cut open;
- Use of the filter on an incorrect, non-approved or non-recommended application;
- Use of the filter in competitive racing, on modified high-performance engines, or on any aircraft or aviation application;
- Damage or failure caused by improper installation, misuse, modification, accidents or abuse;
- Use of motor oil other than the viscosity and type as recommended by the manufacturer of the engine or equipment;
- Costs of repairs not directly attributable to the defective filter;
- Towing fees, rental car fees, or any other fees, expenses, damages, costs or losses that are not specifically provided for in this Limited Warranty.

For products other than filters, this limited warranty DOES NOT COVER damage caused by:

- Improper installation, misuse, negligence, modification, accidents or abuse;
- Failure to follow the product instructions;
- Normal wear and tear.

THIS WARRANTY IS EXCLUSIVE OF ANY OTHER WARRANTY, EXPRESS OR IMPLIED. THE REMEDIES DESCRIBED ABOVE ARE YOUR SOLE AND EXCLUSIVE REMEDIES AND OUR ENTIRE LIABILITY FOR ANY BREACH OF THIS LIMITED WARRANTY. UNDER NO CIRCUMSTANCES SHALL WE BE LIABLE FOR ANY SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES WHATSOEVER, INCLUDING CLAIMS FOR LOSS OF USE OF THE ENGINE OR EQUIPMENT ON WHICH THE FILTER IS INSTALLED, LOSS OF TIME, INCONVENIENCE OR COMMERCIAL LOSS. WE LIMIT THE DURATION AND REMEDIES OF ALL IMPLIED WARRANTIES, INCLUDING WITHOUT LIMITATION THE WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, TO THE DURATION OF THIS EXPRESS LIMITED WARRANTY. FOR FILTERS USED IN COMMERCIAL APPLICATIONS, AND EXCEPT WHERE PROHIBITED BY APPLICABLE LAW, WE EXPRESSLY DISCLAIM, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Some states and other local jurisdictions do not allow limitations on the duration of implied warranties or the exclusion or limitation of incidental or consequential damages, so the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from state to state and other local jurisdictions.

Our WIX Limited Warranty shown above does not apply to WIX Industrial Filtration™, WIX Racing™, ecoLAST®, ProTec® or products sold in China or Mexico.

Warranties for these products, as well as the Spanish and French translations, can be viewed at <http://wixfilters.com/warranty>.
